

DESITE BIM 3.0.2

July, 4th 2022

Release Notes

IMPROVEMENTS & BUG FIXING:

● Issues and Viewpoints

- Fixed a bug where filtering on the first column of the Issues/Viewpoints tree ("Name") did not render the list of available values.
- Fixed a persistence problem for projects with a large amount of viewpoint data (many viewpoints with many visible/selected objects).

● Activities

- The progress output in the status bar when importing of MS Project .mpp files was broken.
- The time unit of the MS Project attributes "TotalSlack" and "FreeSlack" (default: unit="min") can now be configured in the *ConfigImport.mpp.xml* file if required.

● Bill of Quantity

- The ordinal number is now editable again.

● Tools

- When exporting version comparison results to Excel, the "Show WBS in first column" checkbox now has the expected function.

● Model Checking

- Fixed a bug where the options of a check run in the model check domain were not copied when copying the check run via drag & drop.

● API

- New API function *getGlobalProjectPropertyList()* is now available.

● Miscellaneous

- Fixed a rendering issue, when using DESITE on AWS cloud systems.
- Fixed a bug when opening model or project files with umlauts in the file name/path by double-click.
- Fixed a bug that causes a program crash when stopping script execution of a macro.
- The property "cpCountLinkedIssues" is now working properly.
- Datasheet Widget: If many objects are selected (the limit of 25 elements is exceeded), the rendering of the geometric properties is now canceled again so that the application is no more blocked for some time.
