DESITE BIM 3.0.5

September, 28th 2022

Release Notes

IMPROVEMENTS & BUG FIXING:

- **Export**
  - The model export via the API now considers all property providers, not only the model and the project repository. Properties that are not to be exported should be inactivated beforehand or a bookmark should be applied.
- **Import**
  - Fixed the import of IFC import options from a cpr file.
- **Properties**
  - Property scripts: The "Evaluate" button (for selected objects) no longer mistakenly applies the code for script at the same time. The user must now explicitly click "Apply" for code changes to be applied and properties to be recalculated.
- **Documents**
  - Exporting and Re-Importing a Document Model will no longer change the model's ID.
- **Issues and Viewpoints**
  - A persistence bug has been fixed that could cause errors when saving a project to an UNC path (a network path starting with \\).
- **Activities**
  - In the 4D diagram for tasks, the bars are now also still recognizable with large selected time intervals.
