DESITE BIM 2.8.9

August, 31st 2022

Release Notes

IMPROVEMENTS & BUG FIXING:

- **Geometry**
  - When adding a model in the project structure, this model is now selected - as in the other domains - and, if not visible, scrolled to.
- **Export**
  - IFC Export: The optional class attributes 'ObjectType' (IfcObject) and 'LongName' (IfcSpatialElement) are now written if the corresponding properties 'ifcObjectType' and 'ifcLongName' are present.
- **Import**
  - IFC Import: A bug when importing models with geometric representations of spatial structural elements (IfcSite/IfcBuilding/IfcBuildingStorey/IfcSpace) has been fixed.
  - When importing point clouds from the E57 format, a coordinate transformation (global) stored in the file is now taken into account.
- **Properties**
  - Property import (menu DATA): The import with target "Default" was faulty in some places. The properties are set with this setting as manually (via GUI) or via API, special properties like cpLinkRule/-Value are thus also handled correctly.
